

Hyperbaric Oxygen Therapy Vancouver

Hyperbaric Oxygen Therapy Vancouver - Oxidative therapy is done by introducing extra energy in the body. This can be done in 3 ways: using Hyperbaric Oxygen and introducing oxygen into the body under pressure, through an infusion of H₂O₂ or Hydrogen Peroxide into a vein for around one hour or by combining blood with Ozone gas. It just takes a little amount of Hydrogen Peroxide to produce a large amount of oxygen, thus, parts on the body that suffer from poor circulation can benefit very much from the supply of oxygen.

Oxidative therapy has been utilized ever since the 1920's, when Dr. T.H. Oliver initially used Intravenous Hydrogen Peroxide during an outbreak of influenza. This successful treatment helped lots of people and the outcome were reported in the Lancet, a British medical journal. Some years after, Dr. Charles Farr published a paper entitled "Therapeutic Use of Intravenous Hydrogen Peroxide." This paper has become the protocol for physicians who administer H₂O₂.

The theories around this therapy vary in its explanation of the way this particular treatment works. Some researchers and scientists have discovered that the presence of H₂O₂ within the body is more complicated than initially thought. The benefits of Oxidative Therapy have been show useful for the following health sicknesses: Cardiovascular Disease, Cerebrovascular Disease, Coronary spasm, Cardiac arrhythmia, Asthma, Peripheral Vascular Disease, COPD, Pulmonary Diseases, Influenza, Raynaud's Phenomenon, Bronchiectasis, Chronic Bronchitis, Herpes Simplex Virus, HIV, Lupus, Immune Disease, Alzheimer's, Multiple Sclerosis, Fibromyalgia, Chronic Fatigue, Rheumatoid Arthritis, Environmental Poisonings, Parkinson's Disease, Migraines, to name a few.

Because oxidation is a really important energy producing chemical response within the body that makes use of different kinds of oxygen, the treatment should be carefully controlled so as to prevent damage to surrounding normal tissue. Anti-oxidants in the type of vitamins and enzymes protect the body from oxidative damage. On the other hand, the immune system utilizes oxidative energy as a weapon to be able to directly kill infectious agents such as yeast, bacteria, parasites and viruses.
